

This book is part of a series that looks into the senses, introducing young readers to the science of how we perceive and feel things, the importance of our senses and the advantages and disadvantages of being without one of our senses. It concentrates on the function of our sense of touch and shows how our body can feel explaining the role that our nerves and brain play. By learning through games and experiments the young child explores in an entertaining way his or her sense of touch.

Our sense of touch is controlled by a huge network of nerve endings and touch receptors in the skin known as the somatosensory system. This system is responsible for all the sensations we feel – cold, hot, smooth, rough, pressure, tickle, itch, pain, vibrations, and more. The tactile organs are simple receptors connected by nerve axons. The receptors sense pressure on the skin, and that is how you can feel touch. Other areas, such as the back or the soles of the feet, have a lower density of tactile receptors and are less sensitive to touch. Touch provides a simplified view of sensory endings in the skin. Real skin has a lot more – including endings that detect burning pain, freezing pain, itch.

10 Jun - 2 min - Uploaded by MooMoo Math and Science Sense of touch Our sense of touch is controlled by a huge network of nerve endings and. The five senses are: taste, sight, touch, smell, and hearing. Taste. Cookies. Our sense of taste comes from the taste buds on our tongue. These buds are also. The somatosensory system is a part of the sensory nervous system. The somatosensory system . Crude touch (or non-discriminative touch) is a sensory modality that allows the subject to sense that something has touched them, without being. Touch[edit] The touch sense of itching caused by insect bites or allergies involves special itch-specific neurons in the skin and spinal.

The sense of touch is said to have three different qualities: pressure, touch and vibration.

The fifth sense, touch, is actually one of several that operate through the peripheral, spinal, and cranial nerves of the somatosensory system: others are. Using your sense of touch allows you to tell if something is hot or cold, dull or sharp, rough or smooth, wet or dry. Skin is packed with many sense receptors. Your skin gives you the sense of touch through the myriad nerve endings all over your body. Touch is the first of the five senses to develop in a huma.
